SELECTED PROJECTS

Actor-Critic by Committee (ACBC) — Oct. 2019 - Jun. 2020
Associated with: Undergraduate Researcher at Intelligent Dynamics Lab
Hierarchical reinforcement learning algorithms typically use a high-level controller to compose sub-policies sequentially or combinationally. Inspired by work on ensembles, we developed an algorithm, ACBC, in which outputs from multiple sub-policies, or experts, are composed with a linear combination. As the experts can control their weights, ACBC performs both sequential and combinational composition without a high-level controller.

Improving Molecular Simulations through Force Field Development and Computational Techniques — Oct. 2018 - Jun. 2020
Associated with: Undergraduate Researcher at Mobley Lab
smirnoff99Frosst is a molecular dynamics force field, a set of parameters which defines how atoms interact in a system. Like many force fields, smirnoff99Frosst lacks parameters for improper torsions, which determine the planarity of molecules. This project involved building a pipeline which analyzes the eMolecules database of 6 million molecules to create new parameters, thus increasing the accuracy of smirnoff99Frosst.

Multithreaded Affinity Clustering — Jun. 2019 - Sept. 2019
Associated with: Software Engineering Intern at Google
Affinity clustering is a clustering algorithm which approximates the high quality of hierarchical agglomerative clustering while running in linear time. In this project, a multithreaded version of affinity clustering was implemented, optimized, and evaluated. Ultimately, this algorithm has applications in Ads and Search quality. This work is included in two pending publications.
